An astonishing new scientific discovery called neuroplasticity is overthrowing the centuries-old notion that the adult human brain is fixed and unchanging. It is, instead, able to change its own structure and function, even into old age. Psychiatrist and researcher Norman Doidge, MD, travelled around the United States to meet the brilliant scientists championing neuroplasticity, and the people whose lives they've transformed - people whose mental limitations or brain damage were previously seen as unalterable, and whose conditions had long been dismissed as hopeless. We see a woman born with half a brain that rewired itself to work as a whole; a woman labelled retarded who cured her deficits with brain exercises and now cures those of others; blind people who learn to see; learning disorders cured; IQs raised; ageing brains rejuvenated; stroke patients recovering their faculties; children with cerebral palsy learning to move more gracefully; entrenched depression and anxiety disappearing; and lifelong character traits changed. Doidge takes us onto terrain that might seem fantastic. We learn that our thoughts can switch our genes on and off, altering our brain anatomy. We learn how people of average intelligence can, with brain exercises, improve their cognition and perception, develop muscle strength, or learn to play a musical instrument - simply by imagining doing so. Using personal stories from the heart of this neuroplasticity revolution, Dr Doidge has written an immensely moving, inspiring book that will permanently alter the way we look at our brains, human nature, and human potential.

The Aegean Sea holds much for intrigue and piracy. It holds much for astronomy since ancient times. Presently scientists are gathering to view the cosmos on a small island of the coast of Turkey. The island seethes with international criminals and conspiracy. Unexpectedly, the astronomers are forced into becoming sleuths.

The Complete Star Atlas: A Practical Guide to Viewing the Night Sky is the all-in-one guide to the stars. It is a must-have book for anyone who wants to learn the constellations, find the brightest stars, and view the best deep-sky objects. Perfect for all stargazers! This 160-page book from Michael E. Bakich, retired Astronomy magazine Senior Editor, introduces readers, from novice to experts, to observing the night sky with accurate, easy-to-read star maps optimized for use with red flashlights. Maps are accompanied by informative articles and full-color photographs to show everything you can see in the night sky with the naked eye or with a small telescope.

"... the book reminds us of an important lesson in the postwar era of big science: that government policy may lead initially to tremendous support for various fields of science and technology." —Science "... a triumph of historical analysis." —Choice "This is an excellent record of the beginnings of the NASA planetary astronomy program in the years 1958-70." —American Historical Review "The historical circumstances that led to this country's great leap into space were unique, but it is clear that there are many lessons to be learnt from this enthralling tale and Tatarewicz tells the tale well." —Annals of Science When NASA went looking for expertise on the moon and planets following Sputnik, they found that astronomers had long since turned

their telescopes away from our planets and toward the stars. Where were the scientists who could help the United States explore the solar system? The answer, as this important new study shows, was that NASA had to create them. This story of the precipitous rise and decline of planetary astronomy is an important case study of science in an age of state-managed research and development. It demonstrates that the lines between science, technology, politics, and society are anything but fixed and impermeable.

Investigates the history and technical development of the telescope in addition to exploring the scientific impact of the instrument and the discoveries about the universe the telescope has brought about
