The structure property relationship (Table 1.2) gives the material engineer a basis for understanding the nature and behaviour of a wide variety of materials. With such a basic background, the engineer should have the potential to anticipate the properties of material not yet studied, or for that matter not yet developed.

Properties such as the ability to conduct heat or electrical current are determined by the freedom of movement of electrons. This is dependent on the type of bonding present. Knowledge of the microscopic structure of a material allows us to predict how that material will behave under certain conditions.

In very short, depending on the structure (unit cell and bonds) of the material, you have various mechanical properties. In elemental metals there are 3 types of structures that are really important and common: body centered cubic, face centered cubic and hexagonal closed packed. I wrote them in decreasing order of slip systems.

Why is it important to study the crystal structure of a ...  
The major determinants of the structure of a material and thus of its properties are its constituent chemical elements and the way in which it has been processed into its final form. These characteristics, taken together and related through the laws of thermodynamics and kinetics, govern a material's microstructure, and thus its properties.
